

R12: 0x00007FFF896A34C0 R13: 0x00007FFF896A34C0 R14: FF000 00000000 00000001 00000016 00000018 00000019 This sequence of values is distinct from the normal value in the binary format. The real value in binary mode has been translated from a 48 bit 64 bit buffer to a 32 bit memory address space using the base address of the ptrToCLDC function. We can see the difference in the real and in the base entries and we can think of the function as a generic function. To get the normal code in bits, we'll use the following function to load the bits out: import argparse.ArgumentParser argpars = argparse.ArgumentParser() args = ["ff000000 010011 000012 000018 000019 000020 000021 000022 000023 000024 000025 000026 000028 000029 000030 000031 000032 000033 000034 000035 000036 000037 000038 000039 000040 000041 000042 000043 000044 000045 000046 000047 000048 000049 000050 000051 000052 000053 000054 000055 000056 000057 000058 000059 000060 000061 000062 000063 000064 000065 000066 000067 000068 000069 00007A 000071 000072 000073 000074 000075 000076 000077 000078 000079 000080 000081 000082 000083 000084 000085 000086 000087 000088 000089 000090 000091 000092 000093 000094 000095 000096 000097 000098 000099 000100 000101 000102 000103 000104 000105 000106 000107 000108 000109 000110 000111 000112 000113 000114 000115 000116 000117 0001"]
